Excel Macros for Doosan Bobcat ESG Reporting

Installation and Operation of the Energy, Fleet Fuel, and Greenhouse/ESG Report Macros

---

Scope. This procedure applies to the three VBA reporting macros in Table 1. Each macro reads a raw data export, totals it, and writes a formatted report. The source data is kept intact. Install once for everyday use (see Section 1), or embed in the report workbook for traceability (see Section 2).

---

1. Install to the Personal Macro Workbook

(a) Create the Personal Macro Workbook if needed: select *View* > *Macros* > *Record Macro*, set *Store macro in* to *Personal Macro Workbook*, click *OK*, then click *Stop Recording*.

(b) Press Alt+F11 and select *VBAProject (PERSONAL.XLSB)* in the Project Explorer.

(c) Select *File* > *Import File* and choose the macro module (`.bas`).

(d) Remove any older module with the same macro names, or Excel reports an ambiguous name.

(e) Save, close Excel, and click *Save* when prompted for the Personal Macro Workbook.

2. Attach to a Specific Workbook for Traceability

(a) Save the report workbook as an Excel Macro-Enabled Workbook (`.xlsm`).

(b) Select that workbook's *VBAProject* and import the module as in Section 1(c).

(c) Add a button (*Developer* > *Insert* > *Button*) and assign the appropriate macro from Table 1.

(d) Archive the `.xlsm` each period to keep the data, macro version, and run record together.

3. Run a Report

(a) Open the source export.

(b) Press Alt+F8 and select the proper macro from Table 1.

(c) Read the completion message; a warning icon means some rows require review.

(d) Review the exception area in the Excel sheets to check for potential errors.

Table 1. Macro names, functions, and outputs.

Macro (Alt+F8)	Function	Output sheet	Exception area
`GenerateEnergyReport`	Monthly gas and electricity by site	Gas Monthly Report; Electricity Report	Notes block below each report
`GenerateFleetFuelReport`	Fleet diesel and gasoline gallons	Fleet Fuel Report	Rows Needing Review list
`GenerateGreenhouseReport`	Monthly diesel, propane, and water	output data	output exceptions sheet

4. Built-In Safeguards

– Finds columns by header name and validates all data before any output is written.

– Accounts for every row; flags unknown sites, duplicates, and negative values instead of guessing.

– Leaves the source sheet unchanged and restores Excel settings on every exit, including errors.
