Open Orders Report Macro

User manual and road map

Scope. The Excel macro (v2.8) that builds *001. Open Orders – Order Intake – Inventory Analysis By MSA*. It reads the Order Intake, Inventory by Month and Open Order exports for all MSAs from one folder and the size class workbook, and builds one print-ready workbook with banded tables: File Format, Order Intake (all MSAs), Inventory by Month (units by MSA, and the detail), Open Orders by MSA (open orders by MSA and type, charted) and Run Log.

1. Key settings

Table 1. Config settings to check before each run; leave all others at their defaults.

Setting	What it controls
`InputFolder`	Folder with the exports of all MSAs; blank opens a folder picker.
`SizeClassFile`	The size class workbook (models; classes on its Set-up tab).
`MSAColumn`	MSA column of the exports; blank finds it automatically.
`InventoryMonth`	Any day in the month to count; blank uses the latest month.
`ShowCancelled`	FALSE hides cancelled orders behind a filter.
`ShowSSL`	FALSE hides skid-steer loaders behind a filter and off the chart.

2. One-time setup

⚠ **Note:** You must save the macro in the blank worksheet itself, not in the personal worksheet.

(a) Save a blank Excel workbook as `Open Orders Report Builder.xlsm`.

(b) Alt+F11: import `build-open-orders-report.bas`, *Debug > Compile VBAProject*, save.

(c) Run `ShowOpenOrdersReportConfig` (Alt+F8), the only macro listed, to add Config.

(d) Click *Choose size class file...* on Config and pick the size class workbook.

(e) Click *Enable Content* whenever Excel shows the macro security bar.

3. Running the report

(a) Export the three reports for all MSAs into one folder.

(b) Check Table 1, then click *Build report* on Config, the only way to build the report.

(c) Read the Run Log, Last run box and chart; a model the size class workbook does not list is UNMAPPED: add it there and rebuild.

(d) Filter Order Intake (e.g. MSA, then size class): its top row totals the visible rows.

(e) To see cancelled or skid-steer rows, clear the filter on that column.

(f) Print with Ctrl+P: each tab prints landscape, one page wide, with page numbers.

4. Road map

Table 2. Road map from the current macro to automated PowerPoint charts.

No.	Step	Main actions	Done when
1	Confirm rules	Agreed 2026-10-12 and after; one item still open.	Last item answered.
2	Build v2	All MSAs, size list, hidden rows, style, chart, total.	Done 2026-10-15 (v2.8).
3	Test in Excel	Run the test protocol against the hand-built tab.	The protocol passes.
4	Adopt the list	The owner's size class list replaces the starter list.	The workbook is the only source of a class; nothing UNMAPPED.
5	Feed the deck	An *Update PowerPoint* button fills the deck charts.	Deck figures match.
6	Hand over	Name owners; keep all files in one shared folder.	Someone else runs it.
